

Package ‘sim1000G’

July 19, 2017

Type Package

Title Genotype Simulations for Rare or Common Variants using HAPLOTYPES from 1000 Genomes

Version 1.04

Date 2017-06-08

Author Apostolos Dimitromanolakis, Laurent Briollais

Maintainer Apostolos Dimitromanolakis <apostolis@live.ca>

Description Generates realistic simulated genetic data in families or unrelated individuals.

License GPL (>= 2)

Depends R (>= 2.15.2),
stats,
hapsim,
MASS,
stringr

NeedsCompilation no

RoxygenNote 5.0.1

Suggests knitr,
testthat

VignetteBuilder knitr

Encoding UTF-8

LazyData true

sim1000G-package	<i>Simulations of rare/common variants using haplotype data from 1000 genomes</i>
------------------	---

Description

(generic description)

computePairIBD12	<i>Computes pairwise IBD1/2 for a specific pair of individuals</i>
------------------	--

Description

Computes pairwise IBD1/2 for a specific pair of individuals

Usage

computePairIBD12(i, j)

Arguments

- i Index of first individual
- j Index of second individual

Value

Mean IBD1 and IBD2 as computed from shared haplotypes

createVCF	<i>Creates a regional vcf file using bcftools to extract a region from 1000 genomes vcf files</i>
-----------	---

Description

Creates a regional vcf file using bcftools to extract a region from 1000 genomes vcf files

Usage

```
createVCF()
```

Value

none

crossoverCDFvector	<i>Contains recombination model information.</i>
--------------------	--

Description

This vector contains the density between two recombination events, as a cumulative density function.

Usage

```
crossoverCDFvector
```

Format

An object of class logical of length 1.

downloadGeneticMap	<i>Downloads a genetic map for a particular chromosome under GRCh37 coordinates for use with sim1000G.</i>
--------------------	--

Description

Downloads a genetic map for a particular chromosome under GRCh37 coordinates for use with sim1000G.

Usage

```
downloadGeneticMap(chromosome)
```

Arguments

chromosome	Chromosome number to download recombination distances from.
------------	---

generateRecombinationDistances	<i>Generate recombination distances using a chi-square model.</i>
--------------------------------	---

Description

Generate recombination distances using a chi-square model.

Usage

```
generateRecombinationDistances(n)
```

Arguments

n	Number of distances to generate
---	---------------------------------

Value

vector of recombination distances in centimorgan

`generateRecombinationDistances_noInterference`*Generate recombination distances using a no-interference model.*

Description

Generate recombination distances using a no-interference model.

Usage`generateRecombinationDistances_noInterference(n)`**Arguments**

<code>n</code>	Number of distances to generate
----------------	---------------------------------

Value

recombination distances in centimorgan

`generateSingleRecombinationVector`*Genetates a recombination vector arising from one meiotic event. The origin of segments is coded as (0 - haplotype1 , 1 - haplotype2)*

Description

Genetates a recombination vector arising from one meiotic event. The origin of segments is coded as (0 - haplotype1 , 1 - haplotype2)

Usage`generateSingleRecombinationVector(cm)`**Arguments**

<code>cm</code>	The length of the region that we want to generate recombination distances.
-----------------	--

geneticMap	<i>Holds the genetic map information that is used for simulations.</i>
------------	--

Description

Holds the genetic map information that is used for simulations.

Usage

```
geneticMap
```

Format

An object of class environment of length 0.

getCMfromBP	<i>Converts centimorgan position to base-pair.</i>
-------------	--

Description

Converts centimorgan position to base-pair.

Usage

```
getCMfromBP(bp)
```

Arguments

bp	vector of base-pair positions
----	-------------------------------

newFamilyWithOffspring	<i>Simulates genotypes for 1 family with n offspring</i>
------------------------	--

Description

Simulates genotypes for 1 family with n offspring

Usage

```
newFamilyWithOffspring(family_id, noffspring = 2)
```

Arguments

family_id	What will be the family_id (for example: 100)
noffspring	Number of offsprings that this family will have

Value

family structure object

newNuclearFamily	<i>Simulates genotypes for 1 family with 1 offspring</i>
------------------	--

Description

Simulates genotypes for 1 family with 1 offspring

Usage

```
newNuclearFamily(family_id)
```

Arguments

family_id	What will be the family_id (for example: 100)
-----------	---

Value

family structure object

plotRegionalGeneticMap	<i>Generates a plot of the genetic map for a specified region.</i>
------------------------	--

Description

The plot shows the centimorgan vs base-pair positions. In addition it showt the locations of the markers that have been read.

Usage

```
plotRegionalGeneticMap(bp)
```

Arguments

bp	Vector of base-pair positions to generate a plot for
----	--

printMatrix	<i>Prints a matrix</i>
-------------	------------------------

Description

Prints a matrix

Usage

```
printMatrix(m)
```

Arguments

m	Matrix to be printed
---	----------------------

readGeneticMap	<i>Reads a genetic map downloaded from the function downloadGeneticMap.</i>
----------------	---

Description

The map contains a complete chromosome to be used for simulations. The file must be downloaded using the function downloadGeneticMap.

Usage

```
readGeneticMap(chromosome, dir = ".")
```

Arguments

chromosome	Chromosome number to download recombination distances from.
dir	Directory the map file is located.

`readGeneticMapFromFile`*Reads a genetic map to be used for simulations.*

Description

The file must contain the following columns in order: chromosome, basepair, rate(not used), centimorgan

Usage

```
readGeneticMapFromFile(filelocation)
```

Arguments

filelocation	Filename containing the genetic map
--------------	-------------------------------------

`readVCF`*Read a vcf file, with options to filter out low or high frequency markers.*

Description

Read a vcf file, with options to filter out low or high frequency markers.

Usage

```
readVCF(filename = "haplosims/1.vcf", thin = 1, maxNumberOfVariants = 400,  
min_maf = 0.02, max_maf = NA)
```

Arguments

filename	Input VCF file
thin	How much to thin markers
maxNumberOfVariants	Maximum number of variants to keep from region
min_maf	Minimum allele frequency of markers to keep
max_maf	Maximum allele frequency of markers to keep

Value

none

SIM	<i>Holds data necessary for a simulation.</i>
-----	---

Description

Holds data necessary for a simulation.

Usage

SIM

Format

An object of class environment of length 5.

startSimulation	<i>Start the simulation</i>
-----------------	-----------------------------

Description

Start the simulation

Usage

```
startSimulation(vcf, totalNumberOfIndividuals = 250, randomdata = 0)
```

Arguments

vcf	Input vcf file of a region (can be .gz). Must contain phased data.
totalNumberOfIndividuals	Maximum Number of individuals that will ever be generated
randomdata	If 1, disregards the genotypes in the vcf file and generates markers that are not in LD. Generally do not use.

writePED	<i>Writes a plink compatible PED/MAP file from the simulated genotypes</i>
----------	--

Description

Writes a plink compatible PED/MAP file from the simulated genotypes

Usage

```
writePED(vcf, fam, filename = "out")
```

Arguments

vcf	vcf object used in simulation
fam	Individuals / families to be written
filename	Basename of output files (.ped/.map will be added automatically)
